CWD PBX

Safest Telephone Exchange

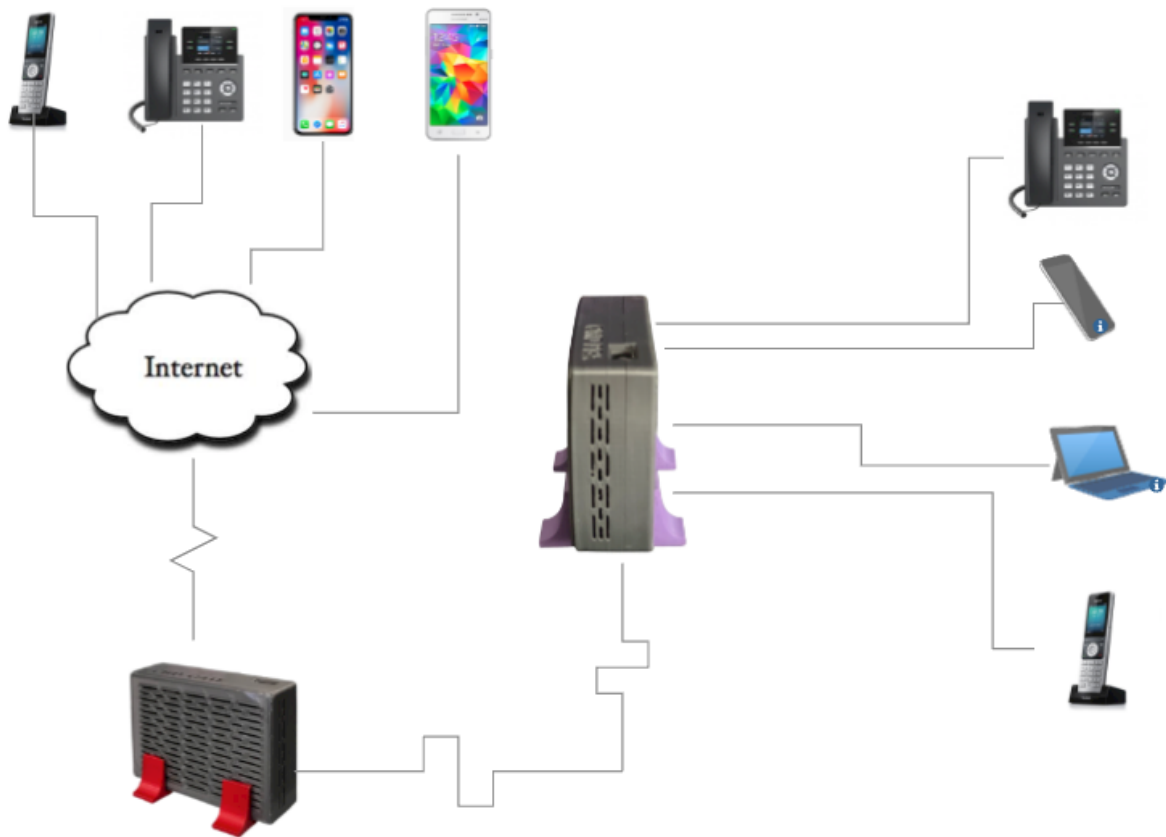

CWD Private Branch Exchange Systems

Product Overview

CWD PBX is a private telephone network system appliance that allows users to talk to each other over a very secure and private voice channel. There is no Publicly Switched Telephone Network (PTSN) or an Integrated Services Digital Network (ISDN) protocol involved in the middle as all voice communications are direct and handled by the appliance.

You can connect multiple remote locations and foreign offices with CWD PBX so staff/users can talk to each other securely. Instead of managing separate phone systems, you would use CWD PBX to handle call routing without the need for an operator even. Our PBX supports Calling Queues (ACD), Conference Bridge, Secure Communications (SRTP/TLS). At any given time, 200 users can take advantage of our PBX without any jitter or voice call quality degradation.

Brilliant Features

As a hosted PBX system, you can manage your phones all from your web browser. Because it's a hosted appliance on your site or off-site premises, almost any device anywhere in the world (via ACLs - Access Control Lists) with an internet connection can use the system, including computers, cell phones, and IP phones. You can avail CWD Gate's Wireguard connect feature to initiate calls through CWD PBX or take advantage of its privacy and routing capabilities from anywhere in the world without any concern of phone taps.

Telephony Support

Open Standards Support for Multiple Protocols, SIP, PJSIP, IAX2, WebRTC Standard Compliance (Real Time Communication), Softphone Support for Android and IOS, Desktop Phone Support, Specialty Device Support, Overhead Paging, Paging Gateways and support for third party outside Voice Gateways.
